

Annealed winding variance: logarithmic versus squared-log fits

● Estimate ± 1.96 SE — Fitted $a + b \log L$ - - Fitted $a + b(\log L)^2$

Error bars are ± 1.96 clustered/jackknife SE. $\Delta BIC = BIC(\log^2) - BIC(\log)$; positive values favor log L.

Quenched winding variance: logarithmic versus squared-log fits

● Estimate ± 1.96 SE — Fitted $a + b \log L$ - - Fitted $a + b(\log L)^2$

Error bars are ± 1.96 clustered/jackknife SE. $\Delta BIC = BIC(\log^2) - BIC(\log)$; positive values favor $\log L$.

Additive scaling-model comparison

Annealed

Quenched

Positive values favor $a + b \log L$; negative values favor $a + b(\log L)^2$.
